Faculty of Humanities And Social Sciences

A Final Year Project Report

"Online Watch Store"

Submitted To

Department of Computer Application

Xavier International College

Boudha, Kathmandu

In partial fulfillment of the requirements for Bachelors of Computer Application

Submitted By

Tsewang Rabten (6-2-546-43-2021)

Under The Supervision of

Sulav Shrestha

Tribhuwan University

Faculty of Humanities and Social

Sciences Xavier International College

Boudha, Kathmandu

SUPERVISOR'S RECOMMENDATION

I hereby recommend that this project prepared under my supervision by **Tsewang Rabten** entitled "**Online Watch Store**" in partial fulfillment of the requirements for the degree of Bachelor of Computer Application is recommended for the final evaluation.

LETTER OF APPROVAL

This is to certify that this project prepared by Tsewang Rabten entitled "**Online Watch Store**" in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion it is satisfactory in the scope and quality as a project for the required degree.

SIGNATURE **Sulav Shrestha** Supervisor Bachelor in Computer Application Xavier International College Boudha, Kathmandu	**SIGNATURE** **Roshan Jha** HOD Bachelor in Computer Application Xavier International College Boudha, Kathmandu

ABSTRACT

Luxx Time is a system where we can find a wide variety of watches for all occasions and needs. Whether we're looking for a stylish watch for everyday wear, a sports watch for outdoor activities, or a luxury timepiece to make a statement, a good hand watch store offers something for everyone. The store usually carries watches from different brands, styles, and price ranges, helping us to find the perfect one that suits our taste and lifestyle. It’s ability to filter and sort watches based on specific criteria. We can search for watches by brand, price, style, material. This helps us narrow down our choices quickly, so we don't have to spend hours browsing through thousands of options. It's an efficient way to find exactly what we are looking for. It usually provides detailed product descriptions, high-quality images, and reviews from other customers. This information helps us to understand the features and benefits of each watch, making it easier to compare different models. One of the biggest issues is the large variety of watches available, which can overwhelm customers and make it difficult for them to find the right watch. Customers can't physically try on watches before buying, which makes it harder to judge things like fit, comfort, or design. Even with detailed descriptions and images, shoppers may still feel unsure about their purchase, increasing the risk of returns. Additionally, a complicated checkout process or unclear shipping details can make the buying experience frustrating, leading to lower customer satisfaction and fewer completed sales.

Keywords: watches, brand, variety, occasions, style, filter etc.

ACKNOWLEDGEMENT

I would like to extend my sincere and heartfelt thanks towards all those who helped me in making this project. Without their active guidance help, cooperation and encouragement, I would not been able to the project.

I extend my sincere gratitude to supervisor HOD for their moral support and guidance during the tenure of my project.

I also acknowledge with a deep sense of reverence, my gratitude towards faculty member of the college for their valuable suggestion.

At last, I’m really thankful to all of them.

CHAPTER 1: INTRODUCTION

1.1 Introduction

The project title “Luxx Time” is an online platform designed to make shopping for watches easy and convenient. It offers a wide range of hand watches from different brands, styles, and price ranges, allowing you to explore many options in one place. Whether we're searching for a sporty watch, a stylish accessory, or a luxury timepiece, this system helps us to find the perfect watch based on your preferences.

Luxx Time is its ability to filter and sort watches based on specific criteria. We can search for watches by brand, price, style, material. This helps us narrow down our choices quickly, so we don't have to spend hours browsing through thousands of options. It's an efficient way to find exactly what we are looking for. It usually provides detailed product descriptions, high-quality images, and reviews from other customers. This information helps us to understand the features and benefits of each watch, making it easier to compare different models.

Luxx Time is a system where we can find a wide variety of watches for all occasions and needs. Whether we're looking for a stylish watch for everyday wear, a sports watch for outdoor activities, or a luxury timepiece to make a statement, a good hand watch store offers something for everyone. The store usually carries watches from different brands, styles, and price ranges, helping us to find the perfect one that suits our taste and lifestyle.

It also makes purchasing a watch simple and secure. Once we've selected the watch we want, we can easily add it to our cart and proceed with a safe checkout process. This watch store systems offer payment options like E-sewa. It is an online tool that simplifies the process of finding and buying watches. By offering an easy-to-use platform with filters, detailed information, and secure payment options, it provides a seamless shopping experience. Whether we're a first-time buyer or an experienced watch collector, the system helps us to find the ideal watch quickly and confidently.

It is a convenient and user-friendly online platform that helps us to find and buy the perfect watch. With its advanced search filters, detailed product information, and secure payment options, it makes shopping for watches easier, faster, and more enjoyable.

1.2 Problem Statement

The online watch store faces several challenges in providing a smooth shopping experience for customers. One of the biggest issues is the large variety of watches available, which can overwhelm customers and make it difficult for them to find the right watch. Customers can't physically try on watches before buying, which makes it harder to judge things like fit, comfort, or design. Even with detailed descriptions and images, shoppers may still feel unsure about their purchase, increasing the risk of returns. Additionally, a complicated checkout process or unclear shipping details can make the buying experience frustrating, leading to lower customer satisfaction and fewer completed sales.

1.3 Objectives

The Objectives are:

- To build a system that provide secure and convenient payment process.
- To build a system that is user friendly for customer shopping on watches.
- To build a system that provide product detail with image to make decision.

1.4 Scope and Limitation

Scope

- User Friendly Environment.
- Users can view various products and buy the product of their choice.
- Users can check availability of the product.

Limitation

- There is no Android or IOS app develop.
- The system uses pre-set and may not support unique customer preferences.

1.5 Development Methodology

Waterfall Model

After reading through all these models. The waterfall model fits the development of this project. The main aim of using this approach is we can focus on each part of the model during the development and come back to it if need be. The project can be easily be broken down into different parts based on this model.

This is the model that is used to develop this project because this project is easy to manage due to the rigidity of the model. This project technology and tools used are not the dynamic and is stable. This system resources are available and trained. This system is easy to manage because it is easy to understand and user friendly so every common user can use it easily.

This system is smooth service and security to the customer because it keeps the record of customer properly safe and secure and provides the detail of product to the customers.

The waterfall is a traditional linear and sequential software model. This SDLC model is easy for small projects. In this model, requirements should be clear and well-defined.

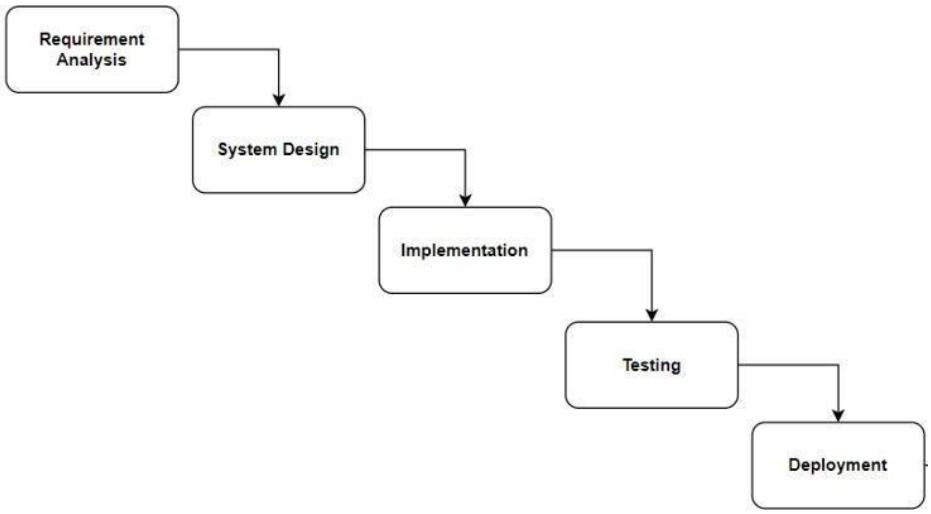

Figure 1.5: Waterfall Model

1.6 Report Organization

The material presented in the project is organized into five chapters.

Chapter 1 represent the introduction, problem statement, objectives, scope and limitation and development methodology of the project.

Chapter 2 describe the fundamental theories and information about existing system, journals and references.

Chapter 3 summarize the keynote on system analysis and design where description of use case diagram, performance and reliability, feasibility analysis, diagrams, database and architectural design.

Chapter 4 provide an account on implementation and testing, tools used for preparation of the project. Test cases for unit testing and integration testing are done.

Chapter 5 represent the outcome, conclusion and future recommendation of the project.

CHAPTER 2: BACKGROUND STUDY AND LITERATURE REVIEW

2.1 Background Study

An Online watch store typically involves a website where customers can browse a variety of watches from different brands. Users can search for watches by category, or filter results by features like brand, price range, material, or style. Product pages usually provide basic details, such as watch specifications, images, and sometimes customer reviews, to help customers make their decision.

While the existing system allows for a convenient online shopping experience, there are still limitations. Customers often face challenges in finding the perfect watch due to the overwhelming number of options, and they can't physically try on the watches to see how they fit or feel. Some online stores may offer customer support, but personalized recommendations or a more interactive shopping experience may be lacking. Additionally, the return and exchange process can sometimes be complicated, which could affect customer satisfaction [1].

2.2 Literature Review

Researcher indicates that there are a few studies and general e-commerce research that touch upon the evolving landscape of online retail, consumer behavior, and challenges in the market. In the context of online watch stores, researchers have examined areas such as consumer preferences, the impact of digital platforms on shopping behavior, and challenges faced by e-commerce businesses.

Sharma & Joshi (2020) explored the behavior of consumers when shopping online, particularly for products like watches and other electronics. Their study found that, although consumers are increasingly turning to online platforms for purchasing products, they still face challenges due to concerns about product quality, delivery times, and the inability to physically examine the products before purchase. This behavior is evident in the online watch market as well, where buyers prefer established brands but remain cautious due to the lack of physical interaction with the product. The study emphasizes that offering a "try-on" option through virtual or augmented reality could help alleviate these concerns and increase consumer confidence in purchasing watches online [2].

Ha & Stoel (2022) studied how perceived security and trustworthiness affect online purchase intentions. Their research found that online watch buyers are more likely to

purchase when they trust the website's security protocols, such as secure payment methods and privacy protection. They also suggested that positive online reviews and ratings from other customers help build trust and reduce the perceived risk of purchasing watches via online [3].

A study by Chang et al. (2021) also found that the availability of detailed product information and transparent return policies positively influenced consumer trust [4].

CHAPTER 3: SYSTEM ANALYSIS AND DESIGN

3.1 System Analysis

It is a process of collecting and identifying the problems, decomposition of a system into its components.

System analysis is conducted for the purpose of studying or its parts in order to identify its objectives. It is problem solving technique that improves the system and ensure that all the components of the system work efficiently to accomplish their purpose.

- Conducted technical, operational and economic feasibility studies to ensure system viability.
- Analyzed the functional and non-functional requirements of the system.
- Design the user interface for the intuition and user friendly experience.

3.1.1 Requirement Analysis

i. Functional Requirement

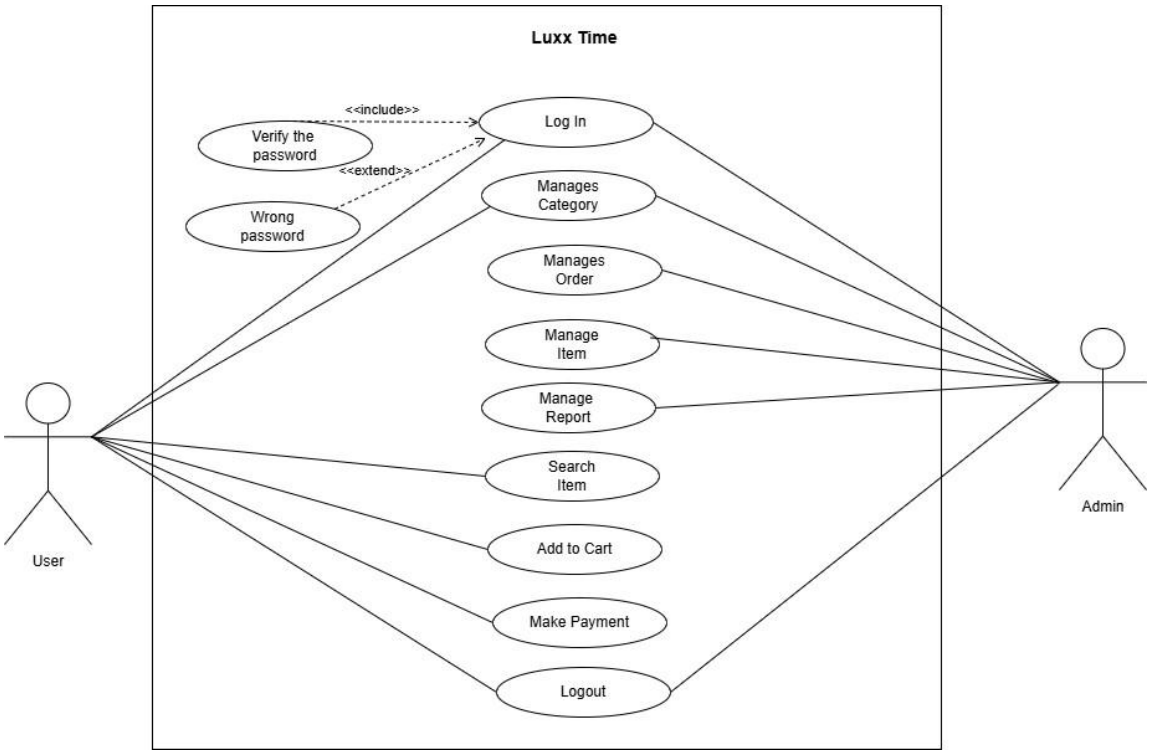

Figure 3.1.1: Use case Diagram

ii. Non-Functional Requirement

- It is simple and easy to use the system.
- Platform should work effectively across different device and browsers.

- Easy to navigate.
- Response time of the system is fast.
- **Usability**
- It is easy to use the system.
- **Performance**
- This system is designed for smooth operation.
- **Reliability**
- It is reliable for the users.

3.1.2 Feasibility Analysis (Technical, Operational, Economic)

- **Technical Feasibility Analysis**

  It is related about technical resources. This system uses offset technologies and hardware. This system needs simple and medium device to run. So, there are no any technical hurdles to building this system.

  - UI of project is very simple
  - It will run on many exiting web browsers with latest versions.

- **Operational Feasibility Analysis**

  It is related about smooth operation of system. This system is easy to use and with simple technologies. This system is user friendly so every common user can use it easily. This system uses well-understood technologies. So, this system requires a minimal amount of training.

- **Economic Feasibility Analysis**

  It is study about cost and balance of system. The cost of doing the full project is minimum and estimated cost of hardware and software is affordable. The project is less and no more burden are needed. The system development does not have any requirement of expensive hardware and software.

3.1.3 Object Modelling using Class and Object Diagram

The Class Diagram shows the structure of the Watch Store system by defining the classes, their attributes and methods. Classes such as User, Product, Cart, Order, Payment, and Admin represent the main entities of the system. Each class contains related data and functions. It acts as a blueprint for the system because it describes how all classes are organized and connected. It helps developers understand the design of the application before implementation. Relationships such as association

and inheritance show how different classes work together to support the functionalities of the system.

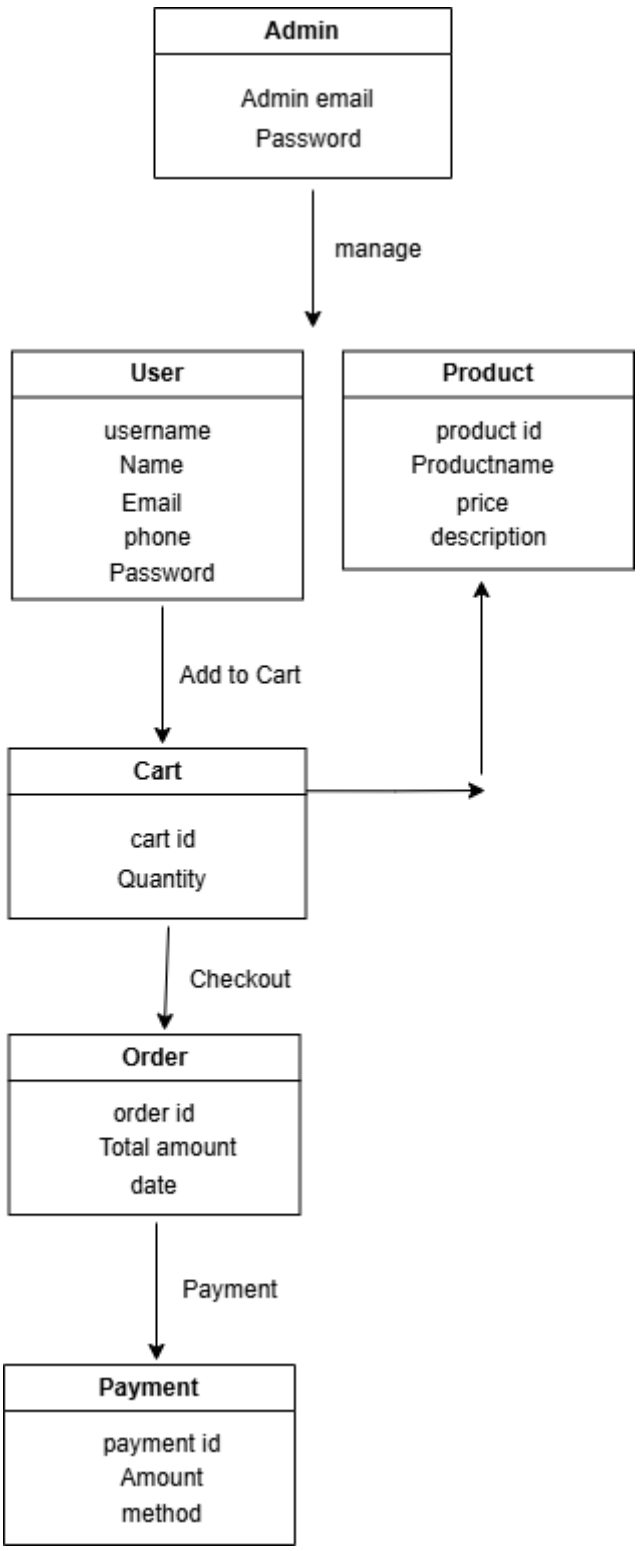

Figure 3.1.3: Class Diagram

Object Diagram helps us understand the real-time state of the system by showing the users, products, carts, and orders. It provides a snapshot of the system and illustrates how different objects interact with one another when a customer browses products, adds items to the cart, and places an order.

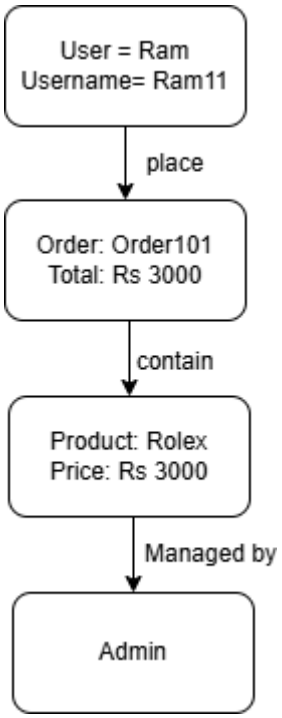

Figure 3.1.3: Object Diagram

3.1.4 Dynamic Modelling Using State and Sequence Diagram

State Diagram helps us understand how the status of an object changes over time. It is useful for tracking the flow of an order and ensuring that every step is completed in the correct sequence. And developers can easily visualize the behavior of the system and manage different stages of an order efficiently. Each state change occurs because of a specific action or event in the system.

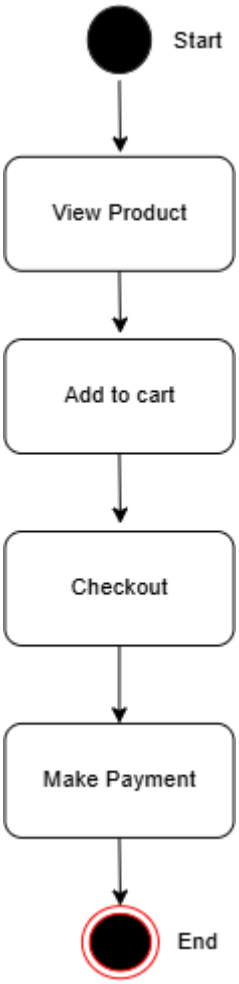

Figure 3.1.4: State Diagram

Sequence Diagram shows how different objects interact with each other over time to perform a task. In this system, the customer first logs in, browses products, adds a watch to the cart, places an order, and makes a payment. During this process, messages are exchanged between the Customer, Website, Database, and Payment System in a specific sequence.

It helps us understand the order of interactions required to complete a particular function. It focuses on the flow of messages between system components and shows how they work together to achieve a goal. It is useful for understanding the step-by-step operation of the system from the user's action to the final response.

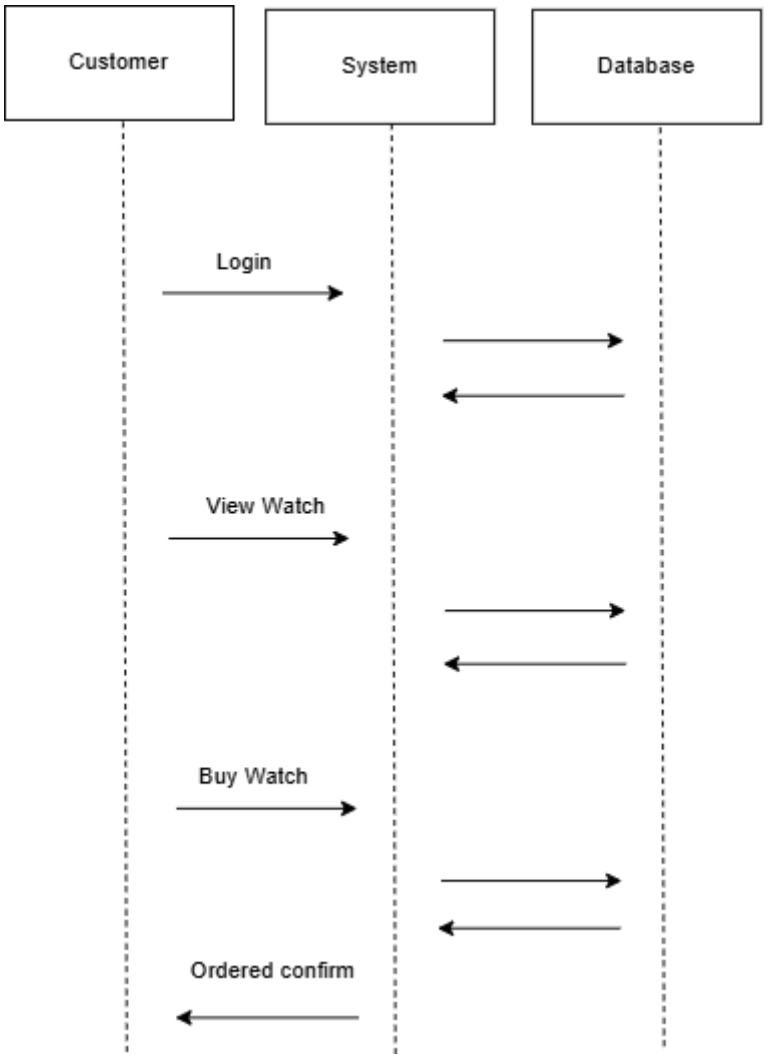

Figure 3.1.4: Sequence Diagram

3.1.5 Process Modelling using Activity Diagram

Activity Diagram shows the complete workflow of activities performed in the system. It starts when a customer visits the website, browses watches, selects a product, adds it to the cart, and proceeds to checkout. After entering the required details and making a payment, the system confirms the order and stores the information in the database. Each activity is connected in a sequence to show how the process moves from one step to the next.

It helps us understand the overall business process of the system in a simple and visual way. It shows the flow of actions, decision points, and outcomes during order processing. By using an activity diagram, developers and users can easily understand how the system works from the beginning of a customer's visit until the successful completion of an order.

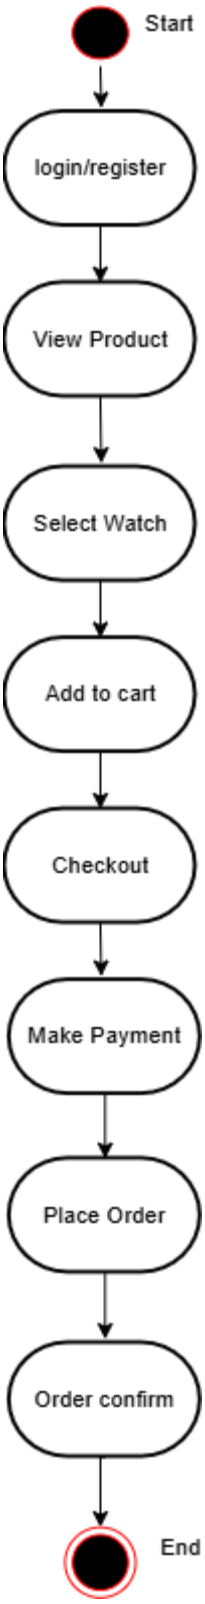

Figure 3.1.5: Process Modelling using Activity Diagram

3.2 System Design

3.2.1 Refinement of Class, Object, State, Sequence and Activity Diagram

The refined class and object diagram helps to clearly organize the system structure. The class diagram shows the main classes such as User, Customer, Admin, Product (Watch), Cart, Order and Payment. It also defines their attributes and relationships, like how a customer can place multiple orders and each order can contain multiple watches. The object diagram is the real-time example of this structure. This makes the system design easier to understand and more practical.

The refined state diagram shows how different objects change their states during the system process. For example, an order in the online watch store goes through different states like New, Processing, Shipped, Delivered, and Cancelled. Similarly, a payment can be in states like Pending, Successful, or Failed. This diagram helps to understand how the system reacts to different actions and how an item or order moves from one stage to another step by step.

The refined sequence diagram shows the step-by-step interaction between users and the system over time. In this system, it shows how a customer searches for a watch, adds it to the cart, places an order, and makes a payment. It also shows how the system, database, and payment gateway communicate with each other. This diagram is useful because it clearly explains the flow of messages between different parts of the system in a simple order.

The refined activity diagram describes the overall workflow of the system in a visual process form. In this system, it starts from user login, then browsing watches, selecting products, adding them to cart, and completing checkout. This diagram helps to understand the complete working process of the system in a clear and easy step-by-step flow.

3.2.2 Component Diagram

Component Diagram shows the main parts of the Watch Store system and how they work together. The user accesses the system through the web interface using a browser. The web interface communicates with different components such as Login and Registration, Product Management, Shopping Cart, Order Management, and Payment modules. Each component performs a specific task to help users browse watches, add products to the cart, place orders, and make payments.

All these components are connected to the MySQL database, which stores important

information such as user accounts, product details, orders, and payment records. The component diagram helps us understand the internal structure of the system and how different modules interact with each other to provide the complete functionality of the system.

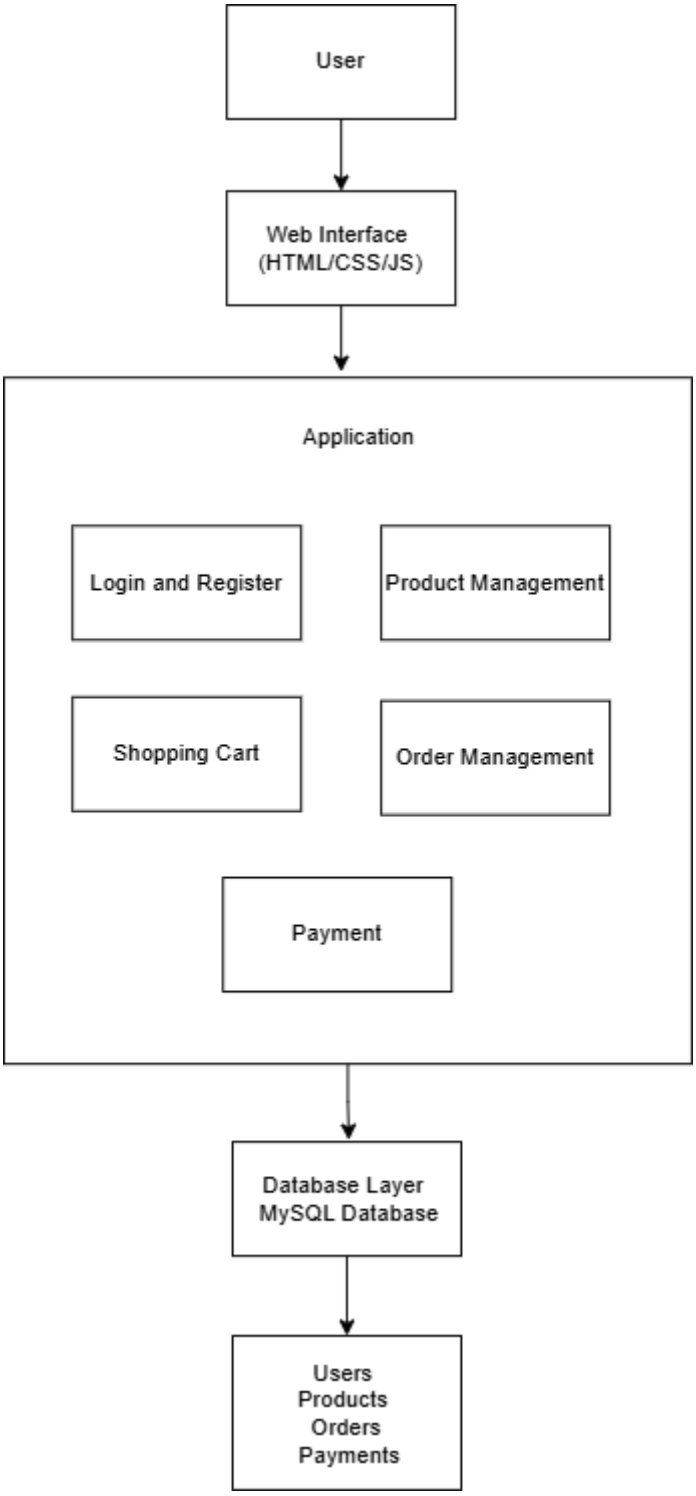

Figure 3.2.2: Component Diagram

3.2.3 Deployment Diagram

Deployment Diagram shows how the system is physically deployed and executed. Customers use a web browser on their computer or mobile device to access the website. Their requests are sent to the web server, which runs the PHP application on an Apache server. The web server processes user requests and manages the business logic of the application.

The web server communicates with the MySQL database server to store and retrieve data such as user information, products, and orders. When a customer makes a payment, the system connects to the eSewa payment gateway to complete the transaction securely. It helps us understand the hardware and software environment required to run the Watch Store system and how different deployment nodes communicate with each other.

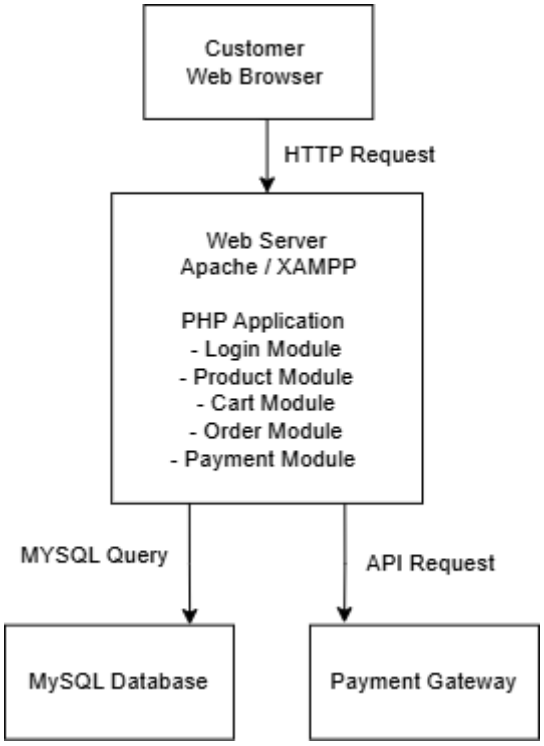

Figure 3.2.3: Deployment Diagram

3.3 Algorithm Used

Content Based Filtering

Content-Based Filtering recommends products by analyzing the attributes of items that a user has shown interest in, such as their features, categories, or styles. If a user likes a certain type of product, the system recommends similar products based on the attributes of

those items. This algorithm that suggests products to users based on the characteristics of items they've previously interacted with or shown interest in.

1. **Item Profile Creation**

Description: Each watch have key attributes like brand, style (sports, luxury, casual) color, price, and more. These attributes are considered the "content" of each watch.

2. **User Profile Creation**

Description: User profile is based on the product they have interacted with, such as products they have viewed, purchased, or added to their wish list. This profile is built using the attributes of the items the user prefers. The system tracks what a user has viewed, liked, or purchased in the past. If a user frequently looks at luxury brand watches with leather straps, this data is stored.

3. **Similarly Calculation**

Description: Following the creation of user and item profiles, the system calculates how well a user's preferences match the features of the accessible products. Cosine similarity is one of several techniques that may be used how well a product's features fit the preferences of the user.

Cosine Similarity Calculation

$$\text{cosine similarity } (A,B) = \frac{A \,.\, B}{\| A \| \times \| B \|}$$

Where:

- A is the user's profile vector (attributes they prefer).
- B is the item’s attribute vector.
- The dot product (A · B) measures the overlap in attributes between the user’s profile and the item.
- || A || is Magnitude (length) of vector A
- || B || is Magnitude (length) of vector B

This formula calculates the angle between the user profile and item profile vectors. A higher cosine similarity value means the product is more relevant to the user's preferences.

Implementation Workflow:

Database Collection:

Description: Collect data from user interactions, such as product views, purchases, and retrieve the attributes of these products from the Luxx Time database.

Item Profile and User Profile Creation:

- **For User Profile:** Create a customized preference profile by combining the features of products a user interacts with.
- **For Items Profile**: Extract relevant attributes such as category and color for database, including category, color.

CHAPTER 4: IMPLEMENTATION AND TESTING

4.1 Implementation

4.1.1 Tools Used (CASE Tool, Programming Language, Database Platforms)

CASE Tools:

- **Diagram Tool**

  The component of the system and the flow of the data control between these components are demonstrate by diagram tool. “Draw.io” and “Lucidchart” are the diagram tool used in the project.

- **Documentation Tool**

  In this project documentation tool is used to assemble, report on system and description. With the help of documentation tool, documentation is done in this project.

- **Coding Tool**

  These tools assist in coding module with all allied element like libraries, function and so on. Visual Studio Code is used as development tools in this project.

Programming Language:

- **PHP**

  PHP stands for Hypertext Preprocessor. It is server-side scripting language, and a powerful tool for making dynamic and interactive web pages. It can create, open, read, write, delete, and close files on the server. PHP can collect form data. PHP can add, delete, modify data in database.

- **MySQL**

  SQL stands for Structured Query Language. In this project SQL is used to insert, update, delete records and create new databases and tables in a database. My SQL is a database system that runs on a server. It is very fast, reliable, and easy to use.

- **HTML and CSS**

  HTML stands for Hyper Text Markup Language. It is used to create static web pages and web application. In this project HTML is used to create web page of the system, adding images and hyper images, videos as well as other web pages. It can be run on any kind of browsers.

  CSS stands for Cascading Style Sheet. It is responsible for the presentation of the documents written in markup language. In this project CSS is used to design the

web page of the system. It is used to make web pages more presentable. It is used in HTML file.

- **JavaScript**

  It is used for web development and web application. In this project java script is used for client side validation. It allows us to implement dynamic features on web page that cannot be done only with HTML and CSS.

4.1.2 Implementation Details of Modules

This system is developed as a web-based platform that allows users to browse, search, and purchase watches online. The system is divided into several functional modules to ensure smooth operation, scalability, and maintainability.

1. User Management Module

   Function

   - User registration (sign up)
   - User login and authentication
   - Profile management (Change password)
   - Password recovery (forgot password system)

2. Product Management Module (Admin Panel)

   Function

   - Add new watches (brand, price, category, image, description)
   - Update product details
   - Delete products
   - Manage Ordered product

3. Product Display Module

   Function

   - Display all watches on homepage
   - Filter products by category (luxury, sports, casual)
   - Sort products by price or popularity
   - Show product details page

4. Filtering Module

   Function

   - Filter by price range
   - Filter by category and style

5. Shopping Cart Module

   Function

   - Add products to cart
   - Remove items from cart
   - Calculate total price

6. Order Management Module

   Function

   - Place order
   - Order status (pending, confirmed, delivered)
   - Admin order management

4.2 Testing

4.2.1 Test Case for Unit Testing

Table 4.2.1: Unit Test for User

S.N	Test Case	Description	Expected Outcome	Result
1.	Login by user	Email: ram@gmail.com Password: ram12345	Could not verify your account	Fail
2.	Registration by user	Email: ram@gmail.com Password: ram12345 Re-password: ram12345	You Registered Successfully	Pass
3.	Registration by user (Invalid)	Email: ram@gmail.com	Email Already taken	Fail

Table 4.2.1: Test Case for Integration Testing

S.N	Test Case	Description	Expected Outcome	Result
1.	Cart and check out integration	Test the integration between cart and checkout. Verify items are transferred correctly to the checkout page.	Items in the cart should appear with correct details in the checkout.	Pass
2.	Search and product listing	Verify that the product search feature interacts correctly with the product listing module.	Relevant products are displayed as per search input on the product listing page.	Pass
3.	Payment gateway integration	Ensure that the payment gateway integrates correctly with the order confirmation system.	Payment should be processed successfully, and an order confirmation should be shown.	Pass
4.	Recommendation System	Test the integration of the recommendation system with user browsing history.	Products recommended should match the user's browsing and purchase history.	Pass

4.2.2 Test Case for System Testing

Table 4.2.2: System Testing of Luxx Time

S.N	Test Case	Description	Expected Outcome	Result
1.	User Registration	Email: ram@gmail.com Password: ram12345 Re-Password: ram12345	You Registered successfully	Pass
2.	User Login	Email: ram@gmail.com Password: ram12345	Logged in successfully	Pass
3.	Place Order	Null	Please fill out the field	Pass
4.	Place Order	Input: Name, email, contact, city, address	Ordered successfully	Pass
5.	Checkout without login	Input: Name, email, contact, city, address	Please login or Register to place on order	Pass

Table 4.2.2: Admin System Testing of Luxx Time

S.N	Test Case	Description	Expected Outcome	Result
1.	Admin Login	Verify that the admin can login using valid credentials.	Admin should be able to login	Pass
2.	Dashboard Access	Test that the admin can access the dashboard after login	Admin should be redirected to the dashboard upon successful login	Pass
3.	Add New Product	Test the functionality of adding new product to the product list	New product be added visible on the product listing page	Pass
4.	Update / Edit Product image details	Verify that the admin can edit product information such as: price, description and images	Product information should be updated and reflected on the user side	Pass
5.	Delete Product	Test the deletion of products from the list	Deleted product should be removed from the product listing.	Pass
6.	Manager Order	Verify that the admin can view, update and manage customer orders	Admin should be able to see order details and change the order status.	Pass

7.	Payment Gateway setting	Test the integration and configuration of the payment gateway setting	Admin should be able to update and configure payment option.	Pass

4.3 Result Analysis

Luxx Time: Online Watch Store project was successfully developed and tested to provide an easy and efficient platform for buying watches online. Users can register, log in, browse different watch products, view detailed product information, add items to the cart, and place orders through the system. It offers a simple and user-friendly interface, making online shopping convenient for customers.

The system also includes an admin panel that allows administrators to manage products, orders, and customer information. Admins can add new watches, update product details, and remove unavailable products. This helps maintain accurate product information and improves overall store management. This project reduces manual work, improves transaction accuracy, and provides customers with a faster and more reliable shopping experience.

Table 4.3: Result Analysis

S.N	Module/Feature	Result Achieve	Status
1.	User Registration and login	Users can create new accounts successfully and login	Completed
2.	Product Display	Watches are displayed with details and images	Completed
3.	Shopping Cart	Products can be added, updated, and removed from cart	Completed
4.	Order Management	Admin can view and manage customer orders	Completed
5.	Product Management	Admin can add, edit, and delete products	Completed
6.	Payment Integration	Payment process is supported by the system	Completed
7.	Order Placement	Customers can place orders successfully	Completed
8.	System Performance	System responds correctly to user actions	Completed

CHAPTER 5: CONCLUSION AND FUTURE RECOMMENDATION

5.1 Conclusion

In conclusion, Luxx Time offers a convenient and efficient way for customers to browse, compare, and purchase a wide variety of watches from the comfort of their homes. With easy access to different brands, styles, and price ranges, shoppers can find the perfect watch to suit their needs and preferences. The convenience of online shopping, coupled with secure payment options and reliable delivery services, makes buying watches online a popular choice for many. Whether for personal use or as a gift, an Luxx Time provides a hassle-free shopping experience with a broad selection at competitive prices.

5.2 Future Recommendation

Luxx Time could focus on expanding its product range to include more exclusive or limited-edition watches to attract collectors and enthusiasts. It could also enhance the shopping experience by offering features like virtual try-ons or personalized watch recommendations based on customer preferences. Improving customer engagement through loyalty programs, special discounts, or offering easy returns would help build long-term relationships. Additionally, investing in better customer service, such as live chat support and faster delivery options, could further strengthen customer trust and satisfaction.
